Core Hunter: an algorithm for sampling genetic resources based on multiple
genetic measures

Table S1 - Expanded results for Table 1

An expanded version of Table 1 is shown below. Values for all measures are shown for each genetic measure being optimized which is indicated in parenthesis. For instance, Core Hunter (MR) indicates 100% weight was allocated to the MR (Modified Rogers distance) measure. Values reported are the mean of 20 independent runs. Shaded cells indicate the value for Core Hunter was worse than either MSTRAT, D-Method, or both, according to the legend below. Values shown in bold are the best observed overall.
